# **Experiment No: 8**

# Title: Pointers and dynamic memory allocation

# **Aim and Objective of the Experiment:**

Write a program in C to demonstrate pointers and dynamic memory allocation

#### COs to be achieved:

CO5: Apply concepts of pointers in dynamic memory allocation and file handling.

#### **Theory:**

- **1. Pointers:** A pointer is a variable that stores the memory address of another variable. It provides a way to indirectly access and manipulate the data stored in memory.
  - Syntax: int \*ptr; // Declares a pointer to an integer
  - Usage:
    - Address-of Operator (`&`): Used to get the memory address of a variable.

int x = 10:

int \*ptr = &x; // ptr now holds the address of x

- Dereference Operator (`\*`): Used to access the value stored at the memory address held by the pointer.

int y = \*ptr; // y now holds the value 10

- Pointer Arithmetic:

Pointers can be incremented or decremented to navigate through arrays or memory blocks. int  $arr[3] = \{10, 20, 30\}$ ;

int \*ptr = arr; // Points to the first element of the array

ptr++; // Now points to the second element

## 2. Dynamic Memory Allocation:

Dynamic memory allocation allows programs to request memory from the heap at runtime, rather than at compile time. This is useful when the amount of memory needed is not known in advance. **malloc**: Allocates a block of memory of a specified size and returns a pointer to the beginning of the block.

int \*ptr = (int \*)malloc(10 \* sizeof(int)); // Allocates memory for 10 integers

**calloc**: Allocates memory for an array of elements, initializes them to zero, and returns a pointer to the memory.

int \*ptr = (int \*)calloc(10, sizeof(int)); // Allocates and initializes memory for 10 integers

realloc: Resizes a previously allocated block of memory.

(Somaiya Vidyavihar University)

# **Department of Science and Humanities**

ptr = (int \*)realloc(ptr, 20 \* sizeof(int)); // Resizes the allocated memory to hold 20 integers free: Deallocates a block of memory previously allocated by `malloc`, `calloc`, or `realloc`. free(ptr); // Deallocates the memory block

#### - Memory Management:

- Heap vs. Stack:
  - Stack: Memory is automatically managed (allocated and deallocated) for local variables.
  - Heap: Memory must be manually managed by the programmer using dynamic memory allocation functions.
  - Memory Leaks: Occur when dynamically allocated memory is not properly deallocated, leading to wasted memory resources.
  - Dangling Pointers: Occur when a pointer points to a memory location that has been deallocated, leading to undefined behavior.

## 3. Practical Applications:

- Dynamic Arrays: Arrays whose size can be determined at runtime. int n; scanf("%d", &n);

int \*arr = (int \*)malloc(n \* sizeof(int));

- Linked Lists, Trees, and Graphs: Data structures that require dynamic memory allocation for nodes.
  - String Manipulation: Dynamically allocated strings that can grow or shrink as needed.

#### 4. Best Practices:

- Always check if memory allocation was successful (i.e., the pointer is not `NULL`).
- Always free dynamically allocated memory when it is no longer needed to avoid memory leaks.
- Avoid dereferencing null or dangling pointers to prevent runtime errors.

Using pointers and dynamic memory allocation, you can write more flexible and efficient C programs that can handle varying amounts of data and complex data structures.

#### Problem Statements: Conclusion:

# Dynamic Memory Management for a Student Database System Background:

In a university, there is a need to manage student records efficiently. Each student record consists of the following details:

- Student ID (integer)
- Name (string)
- Age (integer)
- GPA (float)

The number of students is not fixed and can vary over time. Therefore, the system should be able to dynamically allocate and deallocate memory for student records as needed.

#### **Problem:**

(Somaiya Vidyavihar University)

## **Department of Science and Humanities**

Design and implement a C program that manages a dynamic student database using pointers and dynamic memory allocation. The program should provide the following functionalities:

#### 1. Add a Student:

- o Prompt the user to enter the details of a new student (Student ID, Name, Age, GPA).
- o Dynamically allocate memory to store the student record.
- o Add the student record to the database.

# 2. Display All Students:

o Display the details of all students currently stored in the database.

## 3. Search for a Student by ID:

- o Prompt the user to enter a Student ID.
- o Search the database for the student with the given ID.
- Display the student's details if found; otherwise, display a "Student not found" message.

## 4. Update a Student's GPA:

- o Prompt the user to enter a Student ID.
- o Search the database for the student with the given ID.
- o If found, prompt the user to enter the new GPA and update the student's record.
- o If not found, display a "Student not found" message.

#### 5. Delete a Student:

- o Prompt the user to enter a Student ID.
- o Search the database for the student with the given ID.
- o If found, delete the student's record and deallocate the memory.
- o If not found, display a "Student not found" message.

#### 6. Exit:

- o Deallocate all dynamically allocated memory before exiting the program.
- o Display a message indicating that the program has exited successfully.

#### **Requirements:**

- Use **pointers** to manage the student records.
- Use **dynamic memory allocation** (e.g., malloc, calloc, realloc, free) to allocate and deallocate memory for student records.
- Ensure that the program handles memory allocation failures gracefully (e.g., by displaying an error message and exiting if memory allocation fails).
- Implement a menu-driven interface that allows the user to choose between the different functionalities.
- The program should continue running until the user chooses to exit.

Code:	
#include <stdio.h></stdio.h>	// header files
#include <stdlib.h></stdlib.h>	
#include <string.h></string.h>	
typedef struct Student {	// Structure student containing relevant information
int id;	

(Somaiya Vidyavihar University)

# **Department of Science and Humanities**

```
char name[50];
  int age;
  float gpa;
  struct Student *next;
} Student;
Student *head = NULL;
void addStudent() {
  Student *newStudent = (Student *)malloc(sizeof(Student));
  if (!newStudent) {
    printf("Memory allocation failed!\n");
    return;
  printf("Enter Student ID: ");
  scanf("%d", &newStudent->id);
  printf("Enter Name: ");
  scanf("%s", newStudent->name);
  printf("Enter Age: ");
  scanf("%d", &newStudent->age);
  printf("Enter GPA: ");
  scanf("%f", &newStudent->gpa);
  newStudent->next = head;
  head = newStudent;
  printf("Student added successfully!\n");
void displayStudents() {
  if (!head) {
    printf("No students in the database.\n");
    return;
  Student *current = head;
  while (current) {
    printf("ID: %d, Name: %s, Age: %d, GPA: %.2f\n", current->id, current->name, current-
>age, current->gpa);
    current = current > next:
```

(Somaiya Vidyavihar University)

```
void searchStudentByID() {
  if (!head) {
    printf("No students in the database.\n");
  int id;
  printf("Enter Student ID to search: ");
  scanf("%d", &id);
  Student *current = head;
  while (current) {
    if(current->id == id) {
       printf("ID: %d, Name: %s, Age: %d, GPA: %.2f\n", current->id, current->name, current-
>age, current->gpa);
       return;
    current = current -> next;
  printf("Student not found.\n");
void updateStudentGPA() {
  if (!head) {
    printf("No students in the database.\n");
    return;
  int id;
  printf("Enter Student ID to update GPA: ");
  scanf("%d", &id);
  Student *current = head;
  while (current) {
    if(current->id == id) {
       printf("Enter new GPA: ");
       scanf("%f", &current->gpa);
```

(Somaiya Vidyavihar University)

```
printf("GPA updated successfully!\n");
       return;
     current = current -> next;
  printf("Student not found.\n");
void deleteStudent() {
  if (!head) {
    printf("No students in the database.\n");
     return;
  int id;
  printf("Enter Student ID to delete: ");
  scanf("%d", &id);
  Student *current = head, *prev = NULL;
  while (current) {
     if(current->id == id) \{
       if (prev) {
          prev->next = current->next;
       } else {
          head = current > next;
       free(current);
       printf("Student deleted successfully!\n");
       return;
     prev = current;
     current = current -> next;
  printf("Student not found.\n");
void exitProgram() {
  Student *current = head;
  while (current) {
```

(Somaiya Vidyavihar University)

# **Department of Science and Humanities**

```
Student *temp = current;
     current = current->next;
    free(temp);
  printf ("All memory deallocated. Program exited successfully!\n");
int main() {
  int choice;
  do {
     printf("\nMenu:\n");
     printf ("1. Add a Student\n");
     printf ("2. Display All Students\n");
     printf ("3. Search Student by ID \setminus n");
     printf ("4. Update Student's GPA \setminus n");
     printf ("5. Delete a Student\n");
     printf ("6. Exit\n");
     printf("Enter your choice: ");
     scanf("%d", &choice);
     switch (choice) {
       case 1:
          addStudent();
          break;
       case 2:
          displayStudents();
          break;
       case 3:
          searchStudentByID();
          break;
       case 4:
          updateStudentGPA();
          break;
       case 5:
          deleteStudent();
          break:
       case 6:
          exitProgram();
          break;
       default:
          printf ("Invalid choice! Try again.\n");
```

(Somaiya Vidyavihar University)

```
Output:
 1. Add a Student

    Display All Students
    Search Student by ID
    Update Student's GPA

5. Delete a Student
 6. Exit
Enter your choice: 1
Enter Student ID: 160
 Enter Name: Mayuri
Enter Age: 18
Enter GPA: 8.19
Student added successfully!
 Menu:
 1. Add a Student

    Display All Students
    Search Student by ID
    Update Student's GPA

5. Delete a Student
 Enter your choice: 2
ID: 160, Name: Mayuri, Age: 18, GPA: 8.19
 1. Add a Student
2. Display All Students
3. Search Student by ID
4. Update Student's GPA
 5. Delete a Student
 6. Exit
 Enter your choice: 3
Enter Student ID to search: 160
ID: 160, Name: Mayuri, Age: 18, GPA: 8.19
1. Add a Student
2. Display All Students
3. Search Student by ID
4. Update Student's GPA
5. Delete a Student
6. Exit
 Enter your choice: 4
Enter Student ID to update GPA: 160
 Enter new GPA: 9
 GPA updated successfully!
```

(Somaiya Vidyavihar University)

```
Menu:

1. Add a Student
2. Display All Students
3. Search Student by ID
4. Update Student's GPA
5. Delete a Student
6. Exit
Enter your choice: 5
Enter Student ID to delete: 160
Student deleted successfully!

Menu:
1. Add a Student
2. Display All Students
3. Search Student by ID
4. Update Student's GPA
5. Delete a Student
6. Exit
Enter your choice: 6
All memory deallocated. Program exited successfully!

Process returned 0 (0x0) execution time: 160.452 s
Press any key to continue.
```

#### Post Lab Subjective/Objective type Questions:

- 1. What is a pointer in C?
- a) A variable that stores the value of another variable
- b) A variable that stores the memory address of another variable
- c) A function that points to another function
- d) A data type used for storing strings
- 2. Which operator is used to get the memory address of a variable?
- a) `\*` **b) `&`**
- c) `->` d) `#`
- 3. What does the `\*` operator do when used with a pointer?
- a) Returns the memory address of the pointer
- b) Dereferences the pointer and accesses the value at the memory address
- c) Allocates memory for the pointer
- d) Frees the memory allocated to the pointer
- 4. Which function is used to dynamically allocate memory in C?
- a) \malloc()\
- b) `calloc()`
- c) \text{realloc()}
- d) All of the above
- 5. What is the difference between 'malloc()' and 'calloc()'?
- a) `malloc()` initializes memory to zero, while `calloc()` does not
- b) `calloc()` initializes memory to zero, while `malloc()` does not
- c) `malloc()` allocates memory for arrays, while `calloc()` allocates memory for single variables
- d) There is no difference
- 6. What is the purpose of the `free()` function?
- a) To allocate memory
- b) To deallocate memory

(Somaiya Vidyavihar University)

# **Department of Science and Humanities**

- c) To resize memory
- d) To initialize memory
- 7. What happens if you dereference a null pointer?
- a) The program runs normally
- b) The program crashes or causes undefined behavior
- c) The pointer is automatically allocated memory
- d) The pointer points to the first memory location
- 8. What is the output of the following code?

```
int x = 10;
int *ptr = &x;
printf("%d", *ptr);
```

- a) 10
- b) Memory address of `x`
- c) Garbage value
- d) Compilation error
- 9. What is the purpose of the `realloc()` function?
- a) To allocate new memory
- b) To deallocate memory
- c) To resize previously allocated memory
- d) To initialize memory to zero
- 10. What is a memory leak in C?
- a) When memory is allocated but not used
- b) When memory is allocated but not deallocated, causing wasted memory
- c) When memory is deallocated twice
- d) When memory is allocated using `calloc()`
- 11. What is the output of the following code?

```
int *ptr = (int *)malloc(sizeof(int));
*ptr = 5;
free(ptr);
printf("%d", *ptr);
a) 5
                            b) 0
```

- c) Garbage value
- d) Runtime error
- 12. Which of the following is true about dynamic memory allocation?
- a) Memory is allocated at compile time
- b) Memory is allocated on the stack
- c) Memory is allocated on the heap
- d) Memory is automatically deallocated when the program ends
- 13. What is the correct way to allocate memory for an array of 10 integers dynamically?
- a) `int arr[10];`

(Somaiya Vidyavihar University)

# **Department of Science and Humanities**

- b) int \*arr = malloc(10);
- c) int \*arr = (int \*)malloc(10 \* sizeof(int));
- d) int \*arr = (int \*)calloc(10, sizeof(int));
- 14. What is a dangling pointer?
- a) A pointer that points to a memory location that has been deallocated
- b) A pointer that points to a null memory location
- c) A pointer that points to an uninitialized memory location
- d) A pointer that points to a valid memory location
- 15. What is the output of the following code?

```
int *ptr = NULL;
printf("%d", *ptr);
```

a) 0

b) Garbage value

c) Runtime error

d) Compilation error

#### **Conclusion:**

In this module we learnt about the concepts of pointers in dynamic memory allocation and file handling.

- 1. Pointers: A pointer is a variable that stores the memory address of another variable. It provides a way to indirectly access and manipulate the data stored in memory.
- Syntax: int \*ptr;
- 2. Dynamic Memory Allocation: allows programs to request memory from the heap at runtime, rather than at compile time. This is useful when the amount of memory needed is not known in advance.
